C:Comment: This enzyme mediates the conversion of three acetyl-CoA molecules to one molecivity, and uptakes amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hydroxymethylglutaryl-CoA synthase (EC 4.1.3.5) - Arabidopsis thaliana

S64135

hypothetical protein YGL124c - yeast (Saccharomyces cerevisiae)

NAlternate names: hypothetical protein G2889

Cispecies: Saccharomyces cerevisiae

Cispecies: Saccharomyces cerevisiae

Cispecies: Saccharomyces cerevisiae

Cispecies: SACCESSION: S64135; S72027

Riceran, E.; Rodriguez-Torres, A.M.; Rodriguez-Belmonte, E.; Tizon, B.; Cadahia, J.L.; Cabahited to the Protein Sequence Database, May 1996

A:Reference number: S64134
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A; Molecule type: DNA

Pancreatic ribonuclease (EC 3.1.27.5) - reindeer (tentative sequence)
NyAlternate names: RNase 1; RNase A
C;Species: Rangifer tarandus (reindeer)
C;Date: 31-Dec-1991 #sequence_revision 31-Dec-1991 #text_change 09-Jul-2004
C;Accession: B91418; A00812
R;Ledijenaar-van den Berg, G; Beintema, J.J.

Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.
Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.
SUBMITTED LOCATION: Type I membrane protein.
DEVELOPMENTAL STAGE: Expressed almost uniformly in early embryos.
SIMILARITY: Belongs to the NOTCH family.
SIMILARITY: Contains 6 ANK repeate.
SIMILARITY: Contains 3 Lin/Notch repeats.

-I- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC).
-I- SUBCELLULAR LOCATION: Secreted.
-I- TISSUB SPECIFICITY: Sersessed by the venom duct.
-I- SIMILARITY: Belongs to the conotoxin O-superfamily. Omega-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Neuronal calcium channel antagonists. SUBCELLULAR LOCATION: Type I membrane protein. Upon activation and S1 cleavage, it is released from the cell membrane and enters into the nucleus in conjunction with Su(H).
FTM: Upon binding its ligands such as Delta or Serrate, it is cleaved (S2 cleavage) in its extracellular domain, close to the transmembrane domain. S2 cleavage is probably mediated by Kuz. It is then cleaved (S3 cleavage) downstream of its transmembrane domain, releasing it from the cell membrane. S3 cleavage requires
